

Enhancing PKI

With Voice and Telephony

Presentation by: Andrew Rolfe, Authentify, Inc.

What has Authentify built ...

- ❑ Customizable system to bind data and voice sessions together using independent networks

What does this attempt to solve ...

- ❑ Binding a human to a digital credential or process in an automated way

Use of Voice Biometrics

Biometrics is seen as a promising way to create a definitive, portable representation of someone's identity. Many biometric solutions available today require some combination of specialized hardware, client-installed software, or significant user training in order for them to be successful. While applications for a controlled audience (such as employees) may find this acceptable, externally facing applications must overcome these problems. Authentify provides an approach to enabling networked applications with integrated voice biometrics.

Features of a system combining Web/Telephony/Biometric Technologies...

- ❑ Real-time, interactive, 2-way, out-of-band communication channel
- ❑ Simple Interfaces
- ❑ Familiar Paradigm
- ❑ Ease of Integration
- ❑ Undeniable Contact
- ❑ Multi-factor authentication in one session

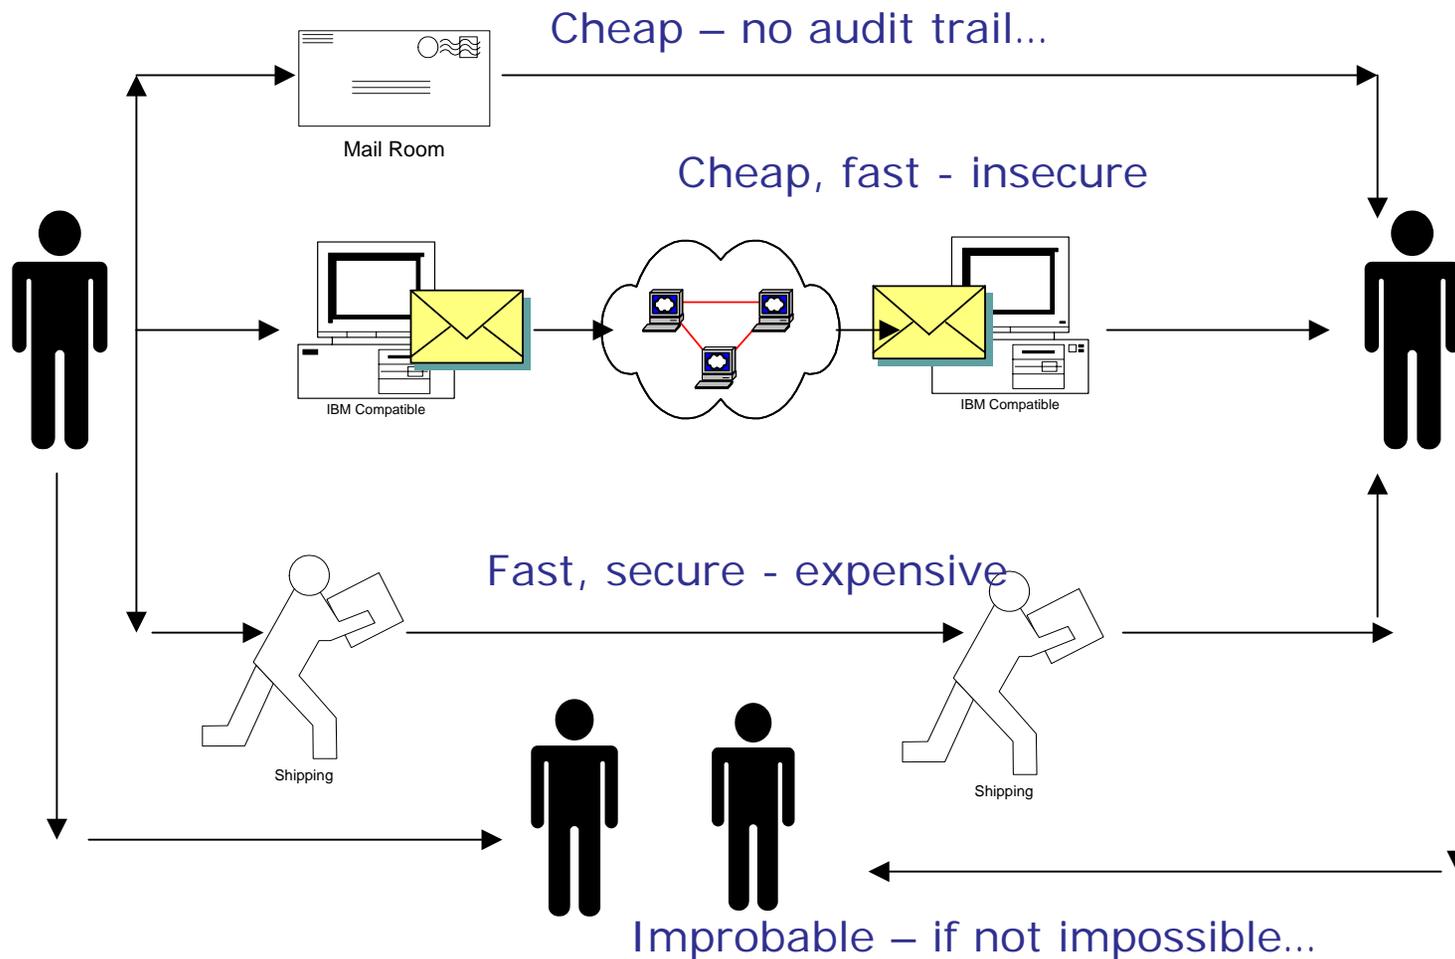

Challenges of Any Registration Process

- ❑ Objective is to bind a carbon based persona to an electronic security credential
 - ❑ The **task** was performed user ID “dduck”, therefore the **person** who performed the task was [certainly] Donald Duck.
- ❑ Policies define process requirements
 - ❑ Policy will (should) reflect risk profile
 - ❑ PKI has inherited some legal baggage (e.g. CPS)
- ❑ Authentication for first time issuance is weak link
 - ❑ Shared secret only is not near strong enough
 - ❑ “Personal presence” models prevalent but expensive and inefficient
- ❑ Delegation is often required to support broad communities
- ❑ Automation is desired to keep costs down

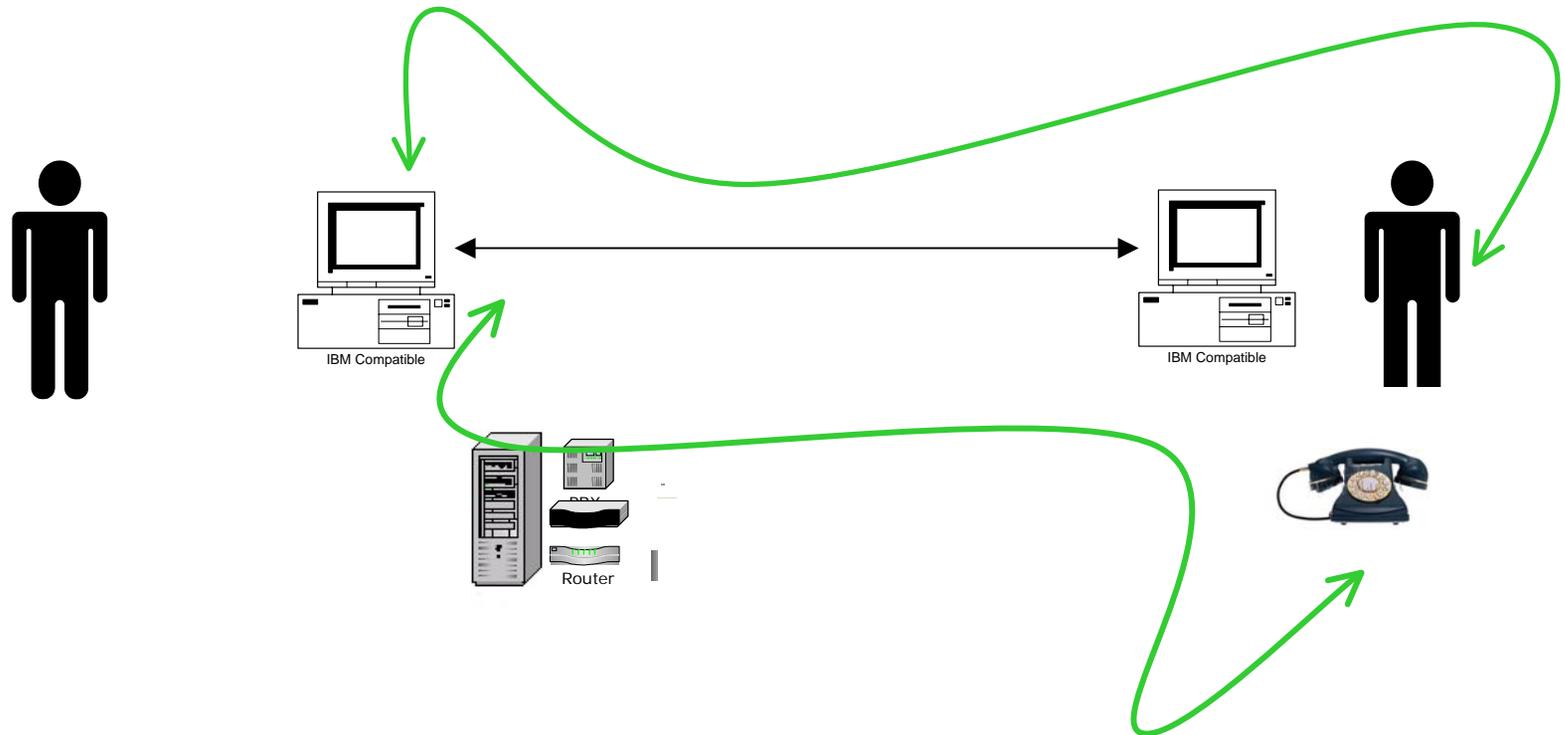

Additional Challenges Attributable to Biometrics

- ❑ “Answer” is no longer discreet
 - ❑ Biometrics are by their nature statistically based
 - ❑ Equal Error Rate becomes something to manage
- ❑ Biometric approach needs to be socialized
- ❑ New risks to consider
- ❑ Required software/hardware footprint, user training
- ❑ Capture device integrity
- ❑ Still have “first time” problem

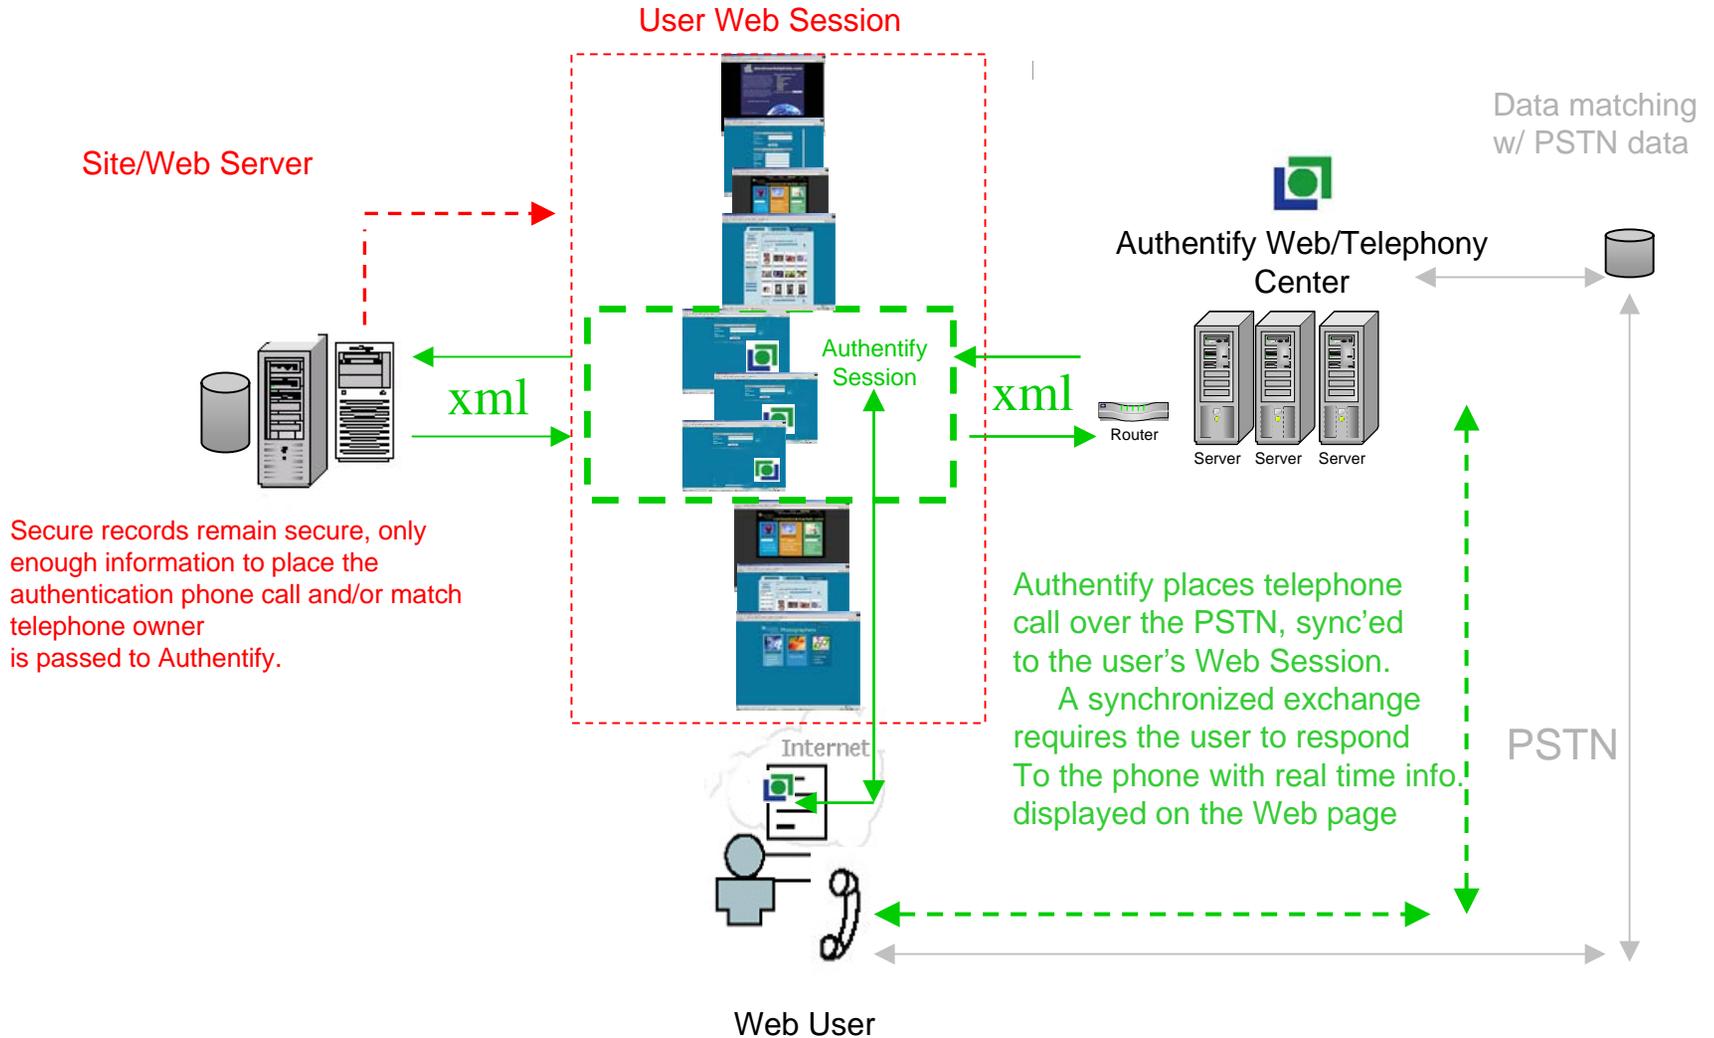

The weakest link in the chain is usually the enrollment process...

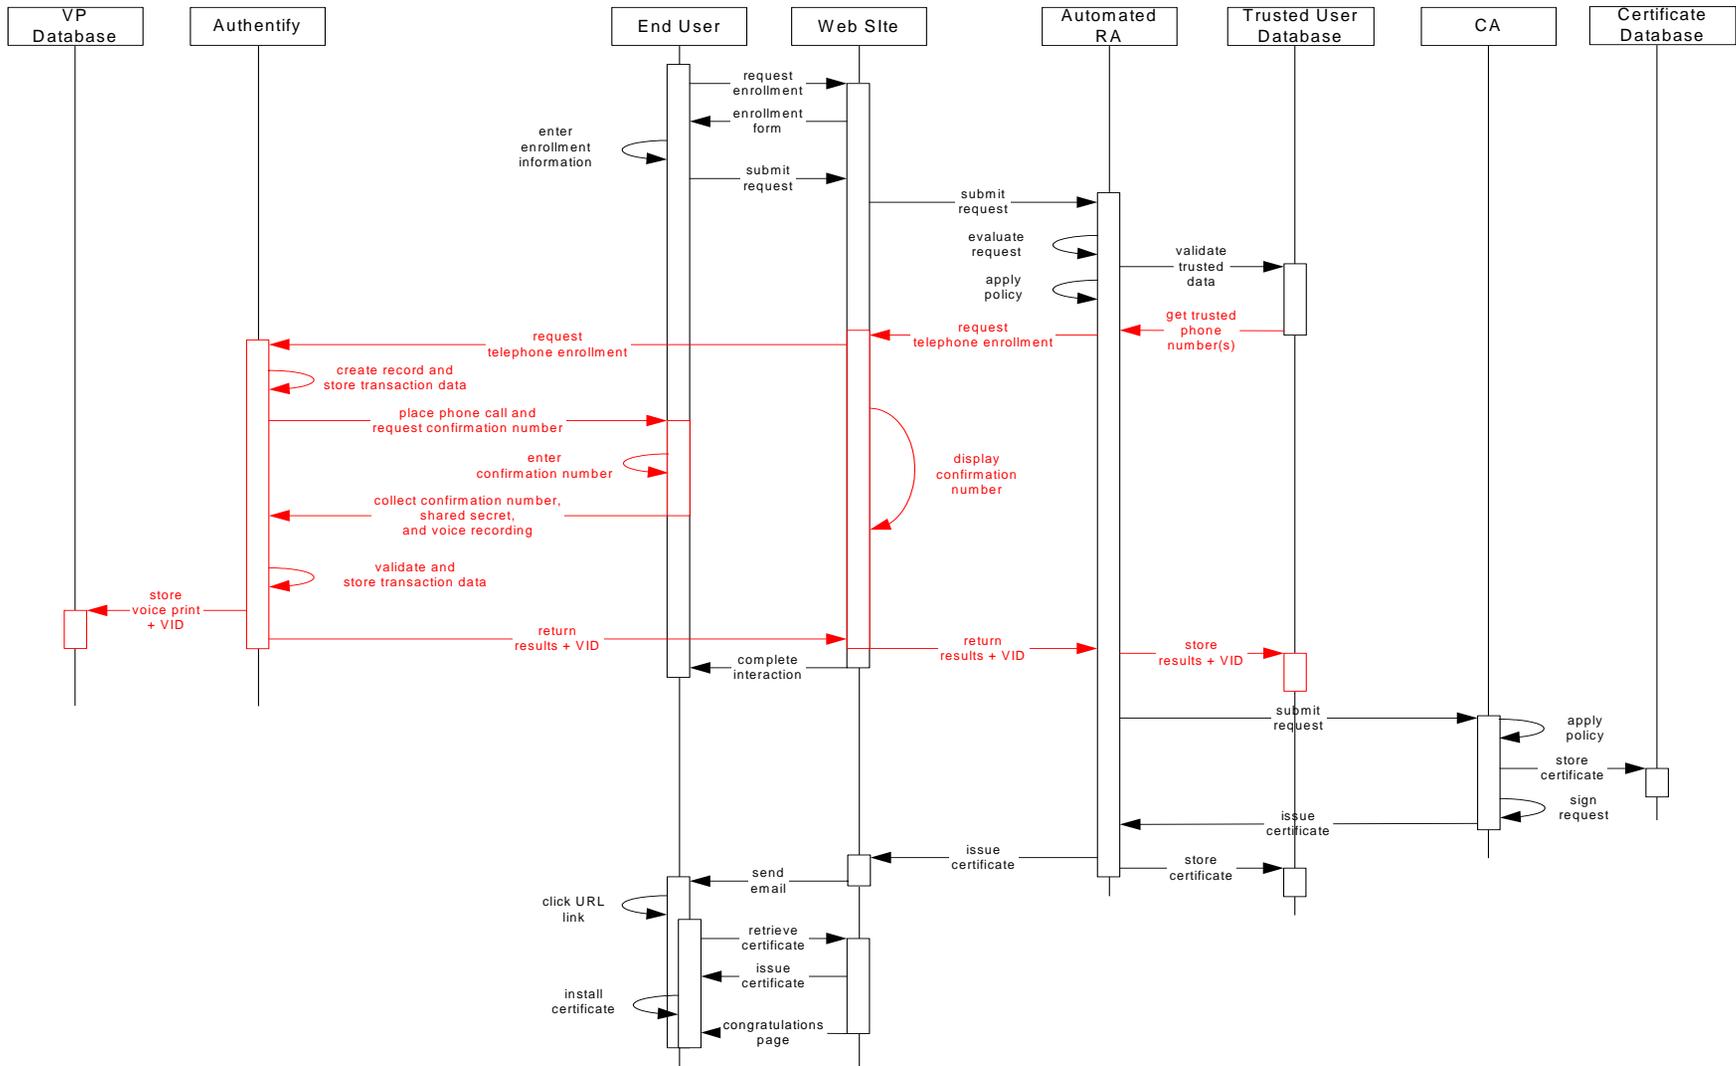

There is a better way that is still tried and true...

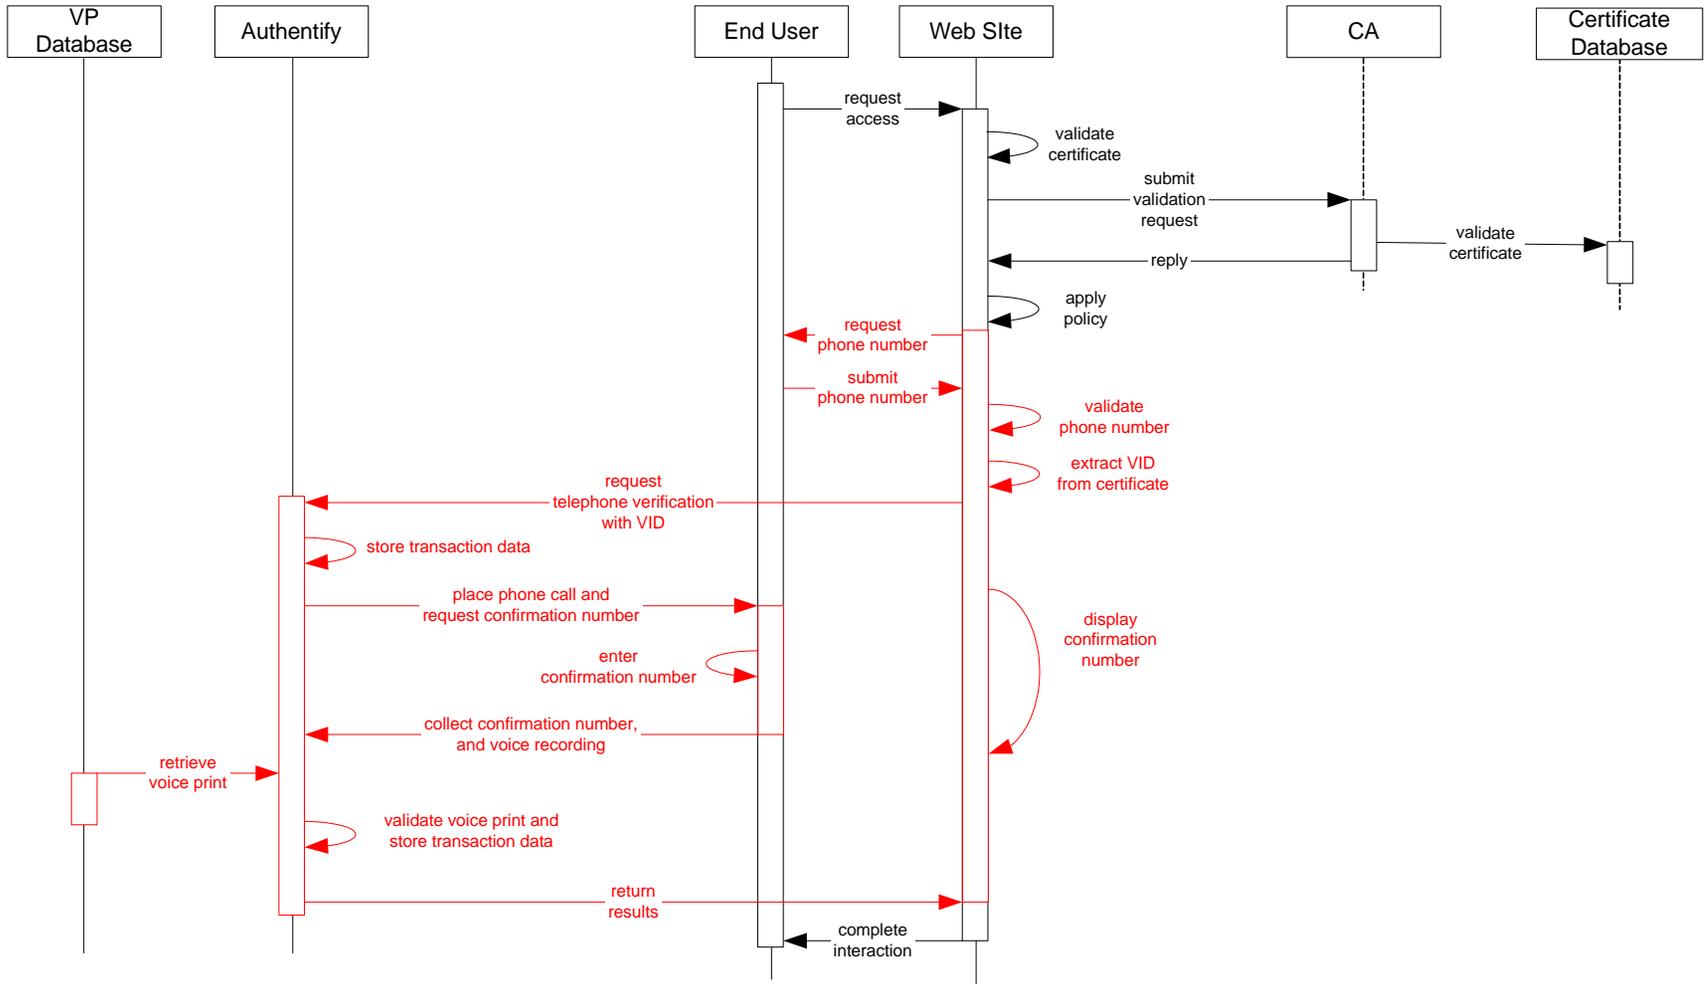

Using the Internet and telephone network simultaneously...

Authentify Integration During Enrollment

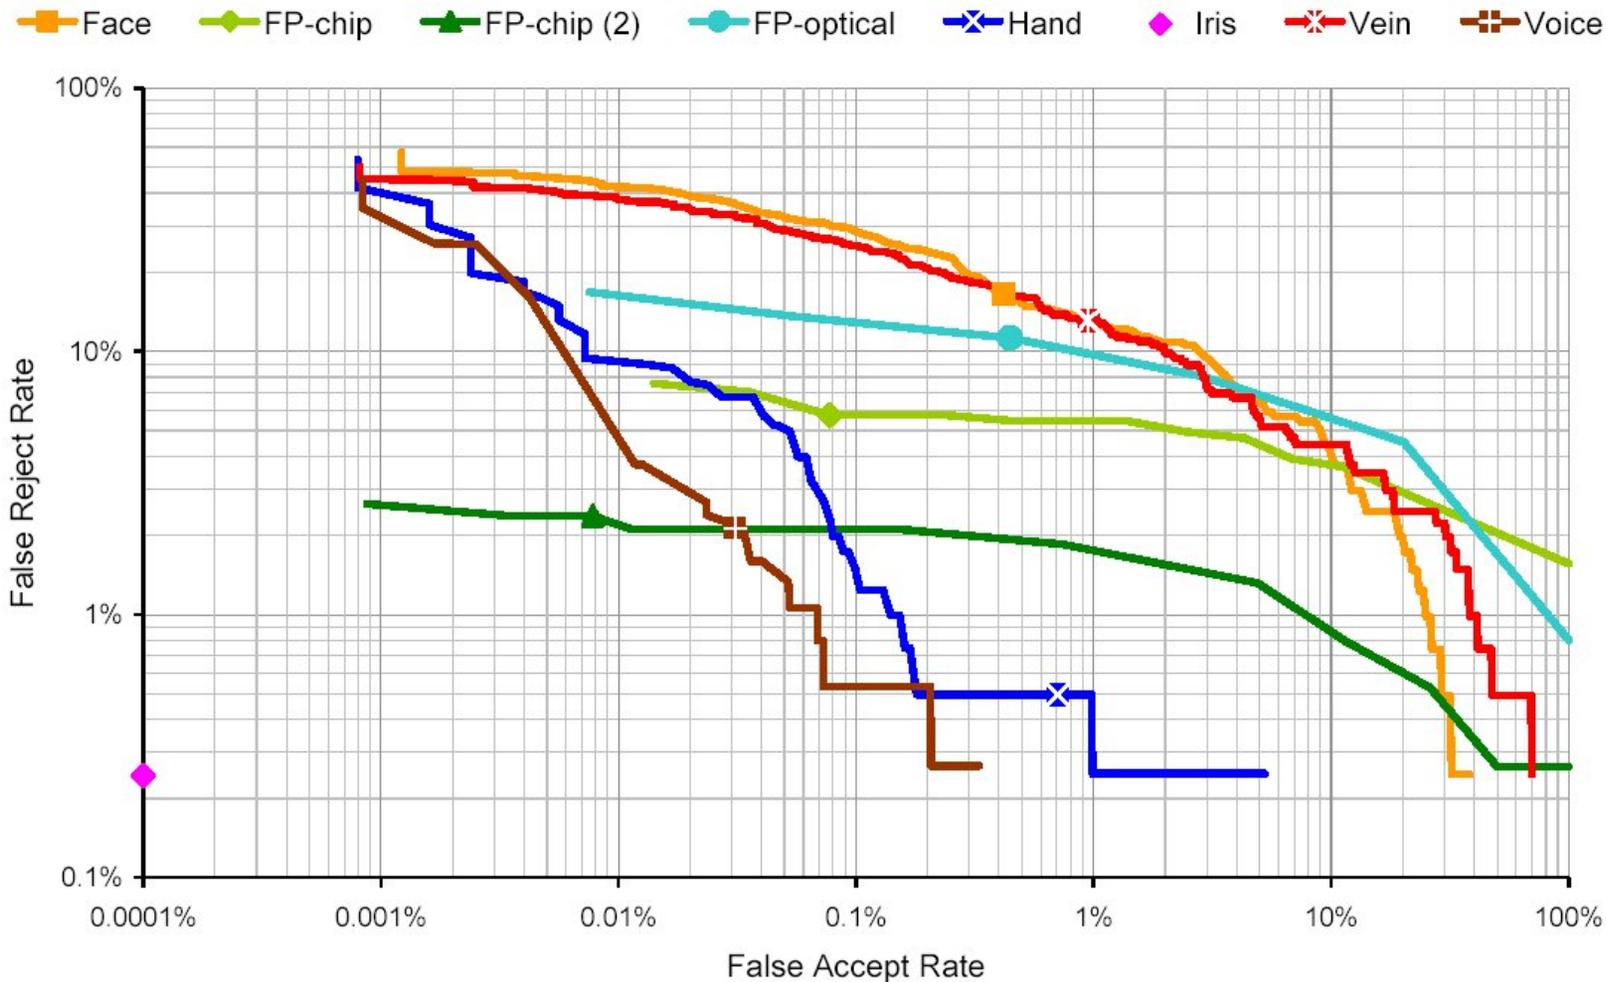

Authentify Integration During Verification

Benefits of Use of the Telephone

- ❑ Out-of-band trusted network
- ❑ Operates in true real-time
 - ❑ Can reduce exposure of temporary PINs to near-zero
- ❑ Uniquely engages a human in the process
- ❑ Requires no additional infrastructure or training
- ❑ Highly auditable
- ❑ Phone is socialized as your “handle” for business
 - ❑ commercial or personal
- ❑ Can temporally bind digital transaction with authentication event
- ❑ Phone number or shared secret is a “something you know”, controlling trusted phone acts as a “something you have”, verification of a voice biometric is “something you are”

Benefits of Telephone as Biometric Security Tool

- Eliminates cost of special devices - only need access to a phone
- No user training
- No device compatibility problems
- Can be handled at a central site
- Strong audit trail

Detection error trade-off: Best of 3 attempts

International Biometric Product Testing Initiative (May – Dec 2000) by National Physical Laboratory, England
 [sponsored by the Communications Electronics Security Group (CESG)]

Use of Voice Biometric To Enhance Digital Certificates

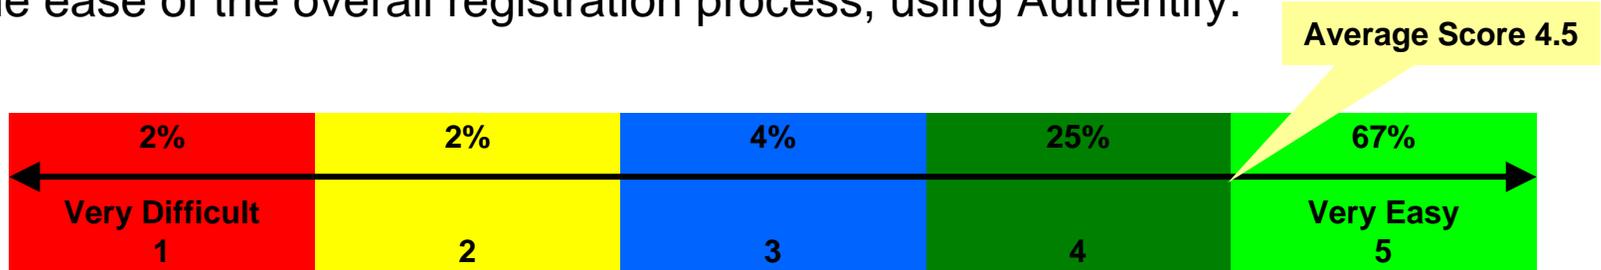

- ❑ Store voice-print ID as signed attribute of Certificate
- ❑ Now the Certificate is truly linked to a person
- ❑ Provides ability to verify user of Certificate in real-time
- ❑ Enables longer Certificate lifespan
- ❑ Can be handled by a networked or third-party service:
 - ❑ More secure due to separation of biometric and identity info
 - ❑ Can handle biometric aging
 - ❑ Can manage multiple voice prints
 - ❑ Isolate the impact of technology enhancements
 - ❑ Archived audit trail
- ❑ Provides a multi-faceted solution – both speed and security

Application Examples

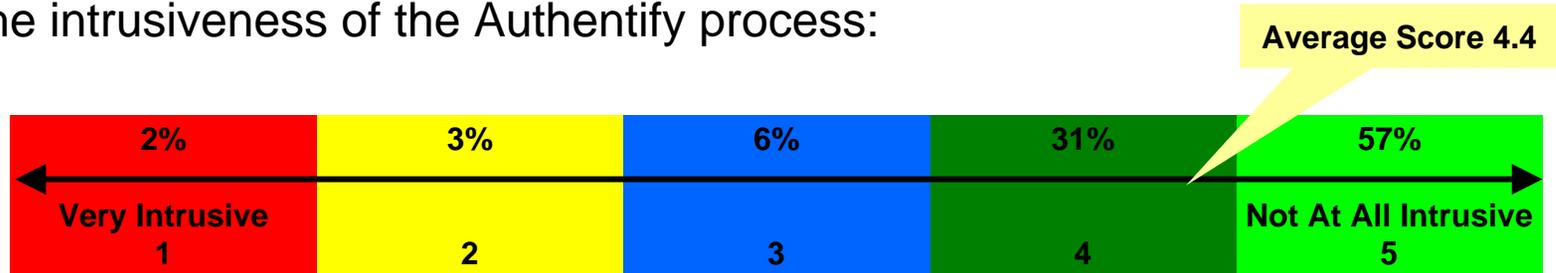

- ❑ PKI Certificate Registration & Enhanced Audit Trail
 - ❑ HP, Atrion, Identrus, Bank of America ...
- ❑ Self-service SSL Certificate Pickup
 - ❑ VeriSign
 - ❑ Multiple calls
 - ❑ originator direct
 - ❑ originator navigated via D&B central number
 - ❑ GeoTrust (international)
- ❑ Account Activation / Maintenance
 - ❑ SSA (email + telephone authorization)
 - ❑ PayPal (location verification)
 - ❑ Associated Bank (branch & on-line biometric capture)
 - ❑ Bank of America (on-line cash management)
 - ❑ Payment One (account authorization)
- ❑ E-Signing
 - ❑ NYC Dept of Health, Inviva

Ease of Use & Intrusiveness

Rate the ease of the overall registration process, using Authentify.

Rate the intrusiveness of the Authentify process:

“I very much like the idea of voice identification. This process surpasses any other method of protecting my identity and SSN that I have seen. BRAVO!!

JoAnn W., Financial Advisory Firm

Conclusion

- ❑ The telephone can be employed as an effective security tool to enable out-of-band processes to occur in real time

- ❑ If the requirement is self-service + out-of-band + auditable + scalable, then telephony presents the only viable solution

- ❑ Coupled with Biometrics & Digital Certificates can provide a multi-faceted solution

- ❑ Questions? Discussion...
